## Chapter VII Homework, 2009

1. Charles Chicken manufactures chicken products. He has an integrated operation which raises, processes and packages chicken for distribution. His operation is broken into 3 parts. Under chicken raising he has the following situation:

| Inputs per chicken | Intensive | Extensive | Not incubated |
| :---: | :---: | :---: | :---: |
| Price of young chick | \$0.20 | \$0.20 | \$0.25 |
| Housing | 4 sq. ft. | $2 \mathrm{sq} . \mathrm{ft}$. | $3 \mathrm{sq} . \mathrm{ft}$. |
| Feed | 4 lbs @ \$0.05/lb. | $\begin{aligned} & 4.1 \text { lbs. @ } \\ & \text { \$0.05/lb. } \end{aligned}$ | 4.2 lbs. @ \$0.05 lb. |
| Farm Labor | 1/2 hour | 1/3 hour | 1/4 hour |
| Cost of misc. services | \$0.10 | \$0.15 | \$0.17 |
| Incubator space | 0.1 sq. ft. | 0.1 sq. ft. | $0 \mathrm{sq} . \mathrm{ft}$. |
| \% of chickens which die or are unacceptable | 10\% | 13\% | 15\% |
| Body weight at maturity | 3.0 lbs. | 2.95 lbs. | 3.1 lbs. |

Of the limiting resources he has ...

| Housing | 55,000 sq. ft. |
| :--- | :--- |
| Labor | 5,000 hours |
| Incubator | 3,000 sq. ft. |

Furthermore, he may buy additional chickens with a body weight of 2.9 lbs . for $\$ 0.75$ of which $3 \%$ are rejected as unacceptable. Suppose you can not buy any more than 1000 .

In his cutting operation the following cut outs are true regardless of body weight:
\% of Total Body Weight by Category

| Neck | $3 \%$ |
| :--- | :---: |
| Legs | $15 \%$ |
| Thighs | $20 \%$ |
| Breast | $30 \%$ |
| Back | $15 \%$ |
| Giblet | $10 \%$ |
| Waste | $7 \%$ |

Cutting a chicken takes 2 minutes labor time. He has 25 men who work 8 hours each. Further, he may hire up to 10 more men for 8 hours/day for $\$ 35.00$ each or may get his existing people to work overtime at $\$ 4.50 / \mathrm{hr}$, up to 300 hours.

In his packaging operation he formulates and sells several products.

| Packed Breasts | in 3 lb packages @ \$1.00/lb. |
| :---: | :---: |
| Packed Thighs | in 3 lb packages @ $\$ 0.95 / \mathrm{lb}$. |
| Packed Legs | in 3 lb packages @ \$0.90/lb. |
| Whole cut up chickens | in 3 lb in same proportions as chickens are cut up excepting waste @ $\$ 0.75 / \mathrm{lb}$. |
| Chicken salad | 3 lb of chicken meat (which comes from the procedure below) which takes 4 minutes of labor per pack (Giblets cannot go in) @ \$1.40/lb |
| Giblets | 1 lb packages @ \$0.70/lb. |
| Backs | in 3 lb packages @ \$0.20/lb. |
| Necks | in 3 lb packages @ \$0.15/lb. |
| Boned Chicken Meat | in 3 lb packages @ \$1.05/lb. |

For chicken salad or boned chicken he bones out chicken meat as follows:

| Necks $\quad$ yield $10 \%$ meat |  |
| :--- | ---: |
| Legs | yield $60 \%$ meat |
| Backs $\quad$ yield $20 \%$ meat |  |
| Thighs yield $70 \%$ meat |  |
| Breastsyield $85 \%$ meat |  |

Waste must be disposed of @ .01/lb.
a) Formulate a profit maximizing LP
b) Setup and interpret the dual equation for the major different types of variables.
c) Design a set of reports for management. Indicate how you would combine activities into the reports.
d) Draw a flow diagram of the formulation.
2. Suppose you are in charge of the Contgill grain and you have the problem of managing company storage. Further, you know today:
a) Grain can be sold for $\$ 2.00 /$ bu and you think the price will go up by $5 \notin$ per bushel per month the next 8 months, then down by $10 \notin$ for the subsequent four months.
b) It costs you $2 \nless /$ month/bu. to keep the grain.
c) Eight months from now your chairman has said 10\% of the grain you have on hand must be committed to PL 480, for which you are not reimbursed. You must commit at least 50,000 bushels.
d) You have 10,000,000 bushels of grain on hand.
e) $0.1 \%$ of the grain spoils each month.

Set up a profit maximizing LP.
3. The Peck family is studying whether to make an offer on some property. Currently, the Peck's own two farms and a feedlot in Illinois. The option they are considering is the purchase of some land in Montana. The land in Montana would be used to raise cattle which would be in part fed to slaughter age in Montana and in part shipped to Illinois for feeding. Technical data follows:

Farm Data
Farm 1
Farm 2
Land Plowing

| Acres/hour | 3 | 2.5 |
| :--- | :---: | :---: |
| Labor /hour plowing | 1 | 1 |

Planting Corn
Acres/hour 5
Labor/hr of planting 1
Planting Soybeans

$$
\begin{array}{lll}
\text { Acre/hour } & 6 & 8
\end{array}
$$

|  | Labor/hr of planting | 1 | 1 |
| :--- | :--- | :---: | :---: |
| Harvesting Corn |  |  |  |
|  | Acre/hour | 3 | 3 |
| Harvesting Soybeans | Labor/hour | 1.5 | 1.5 |
|  |  |  |  |
|  | Acres/hour | 5 | 5.5 |
|  | Labor/hour | 1.5 | 1.5 |

Corn yields in bushels on Farm 1 are:

|  | Planting Date |  |  |
| :---: | :--- | :---: | :---: |
| Harvest Date | October | May | June |
|  | November | 120 | 110 |
|  |  | 140 | 130 |

Corn yields on Farm 2 are 90\% of those on Farm 1.
Soybean yields in bushels (bu) on Farm 1 are:

|  | Planting Date |  |  |
| :---: | :--- | :---: | :---: |
| Harvest Date |  | May | June |
|  | September | 40 | 38 |
|  | October | 45 | 42 |

Soybean yields on Farm 2 are 110\% of those on Farm 1. Plowing is done in December, March, April or May. Farm labor is shared between the farms and there are 60 hours in each month with 4 people working. Farm 1 has 300 acres, Farm 2 has 200 acres.

| Feed Lot Data | Characteristics of Alternative Feeding <br> Systems per Feeder Animal |
| :--- | :--- |

| Method Number | 1 | 2 | 3 | 4 |
| :--- | :---: | :---: | :---: | :---: |
| Final Animal Weight/lbs. | 900 | 870 | 900 | 920 |
| Bushels of Corn | 40 | 45 | 30 | 42 |
| Bushels of Soybeans | 10 | 5 | 20 | 6 |
| Other Costs | 20 | 25 | 15 | 30 |

Market Data:
Purchase cost of feeder animals
\$125/head \$3.00/bu
Market price of corn (same to both farms)
Market price of soybeans (same to both farms)
Cost of purchasing feed
Price of fed beef applicable to final animal weight
\$6.75/bu
120\% of market price \$50/100 lbs

Cost of raising corn soybeans
Transport Costs:
Farm 1 to Feedlot

| Corn | $\$ 0.05 / \mathrm{bu}$ |
| :--- | :--- |
| Soybeans | $\$ 0.12 / \mathrm{bu}$ |

Farm 2 to Feedlot
Corn
Soybeans
\$0.12/bu
\$0.10/bu
\$0.05/bu
\$100/acre
\$ 60/acre

Assume purchased feed and crops sold to market have a zero transport cost.

## Montana Proposal

Land/cow unit: 5 acres
Number of feed animals raised in year per cow unit: 0.7
Land utilized per feeder raised to sale: 5 acres
Cost/cow unit: \$55/year
Cost/feed animal to ship to Illinois: $\$ 10 /$ feeder
Weight of feeders raised to mature animals and slaughtered in Montana: 600 lbs.
Cost/feeder raised to maturity in Montana: \$50
Annualized Land cost in Montana: \$5/acre
Price feeders raised to sale weight in Montana: \$.50/lb.
Maximum market potential in Montana: 500 head of feeders raised to maturity
a. Formulate a model for optimum firm size including both farms, the feedlot, and the Montana option.
b. Discuss how you would use this model to determine whether to invest in Montana land.
c. What types of formulations are implicit in this solution relative to those in the chapter (resource allocation, etc.)?
5. Assume you are hired by a meat packing firm which has W warehouses and P plants. Assume each of the plants makes N products by M processes. The plants have R resources. The warehouses each face fixed demand for all goods. Assume the firm has asked you to build a model for them to determine
(a) Which plants produce which products
(b) Where goods produced at plants should be shipped.

Formulate this problem in a general summation notation fashion specifying the data you would need
6. Apply the homogeneity of units test to the improper model in figure 6.5 and discuss any problems you find.
